

R O M E
ROBOTIC OPTICAL ENGINE®

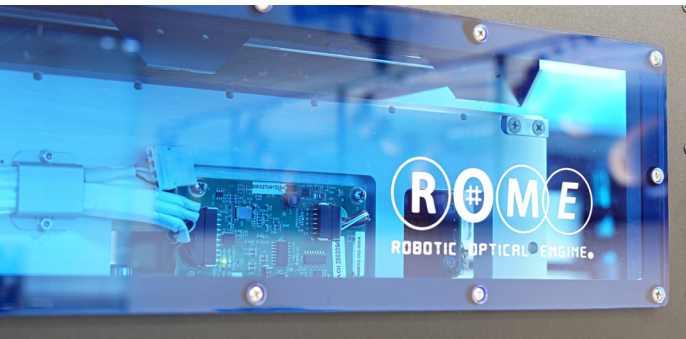

It started with a sketch.

to...

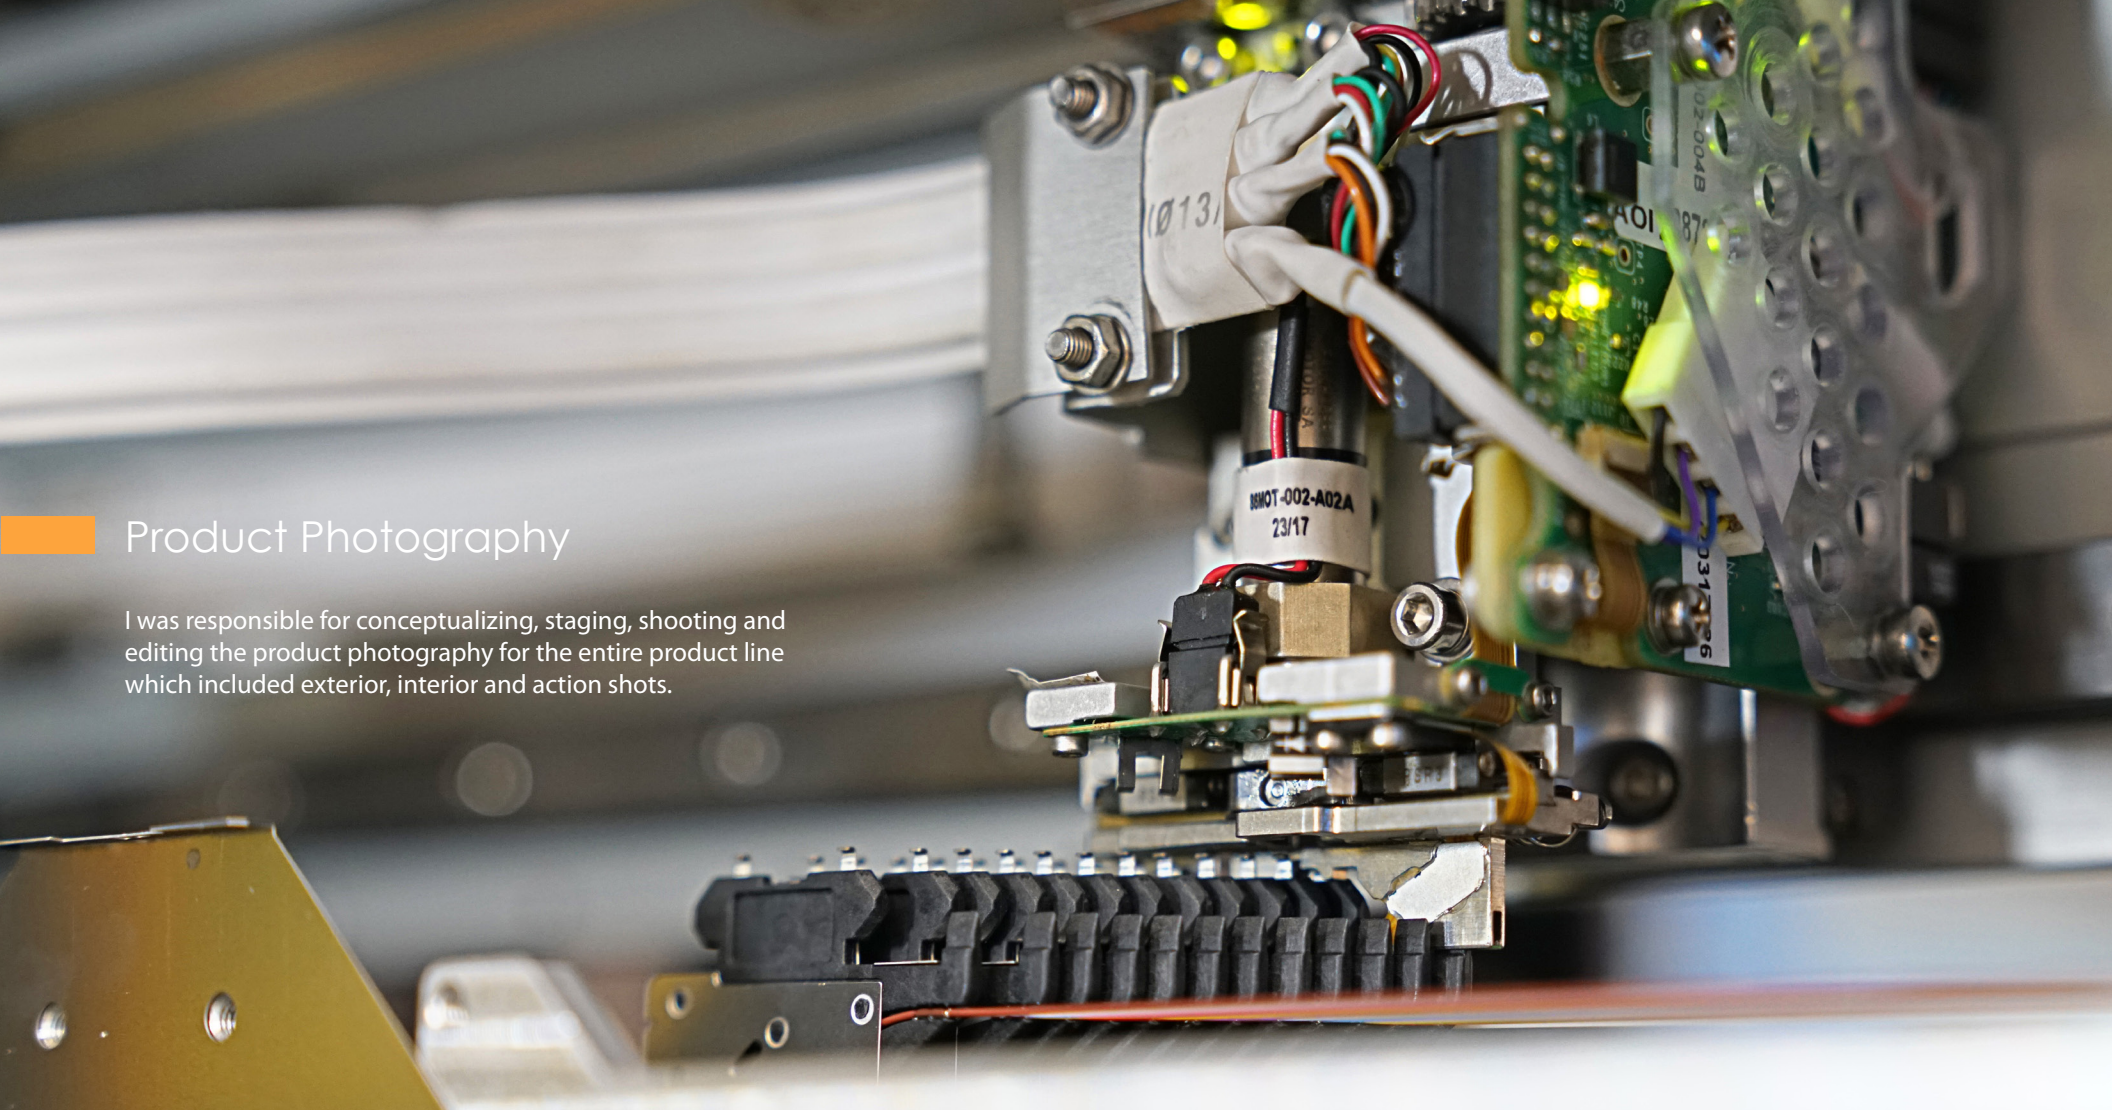

I have been the creative director on the ROME project. ROME is a robotic network switch that enables layer-0 automation. The company made an acquisition of this technology 5 years ago and wanted to do a re-launch which included new branding, re-engineering of the chassis, and go-to market. The CEO came up with the new name, and it started with a sketch of the logo.

Industrial Design

After the acquisition, and during the initial process, I worked with leadership, R&D and the hardware engineers to design the new chassis. My contribution was the front facade of the switch, including the plexy glass design, brand markings, and the patch panel design.

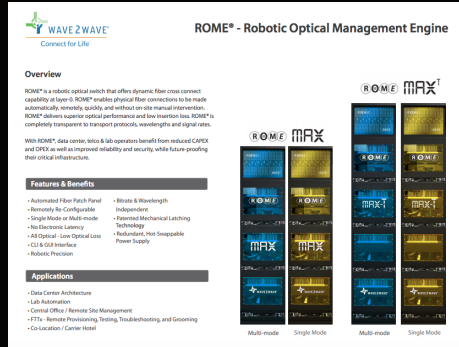

Product Photography

I was responsible for conceptualizing, staging, shooting and editing the product photography for the entire product line which included exterior, interior and action shots.

Sales Enablement & Marketing Collateral

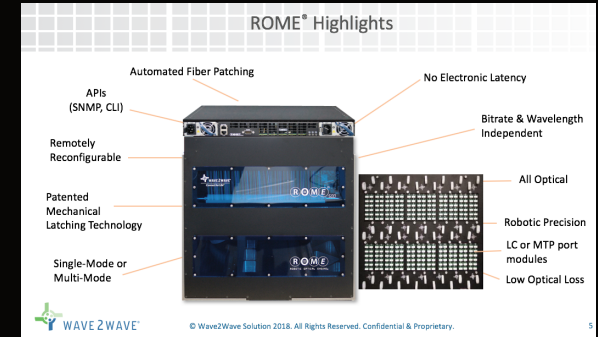

Data Sheets

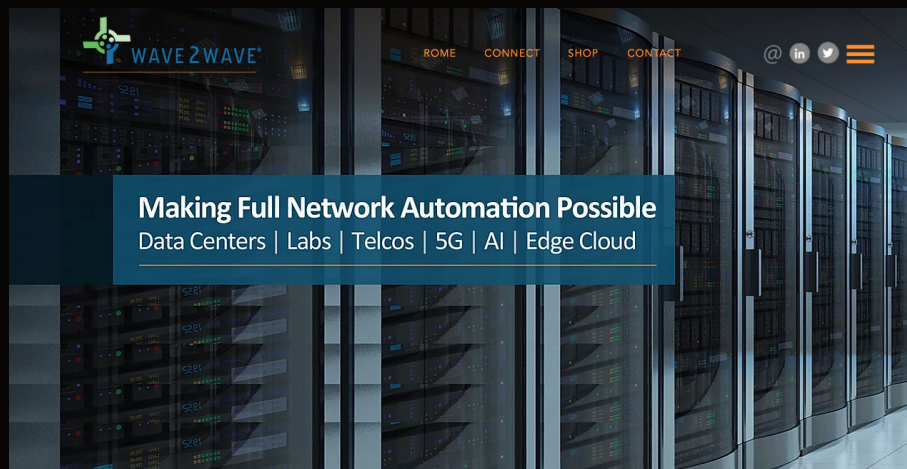

Brochures

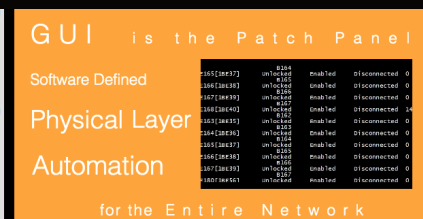

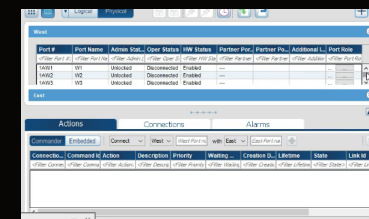

PowerPoints

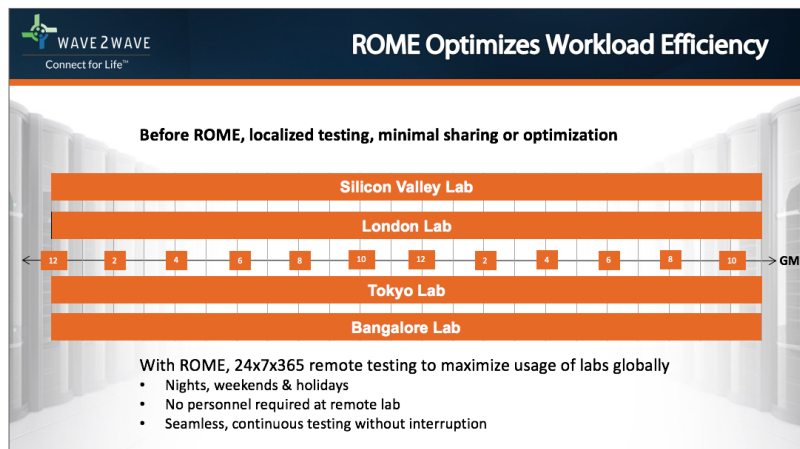

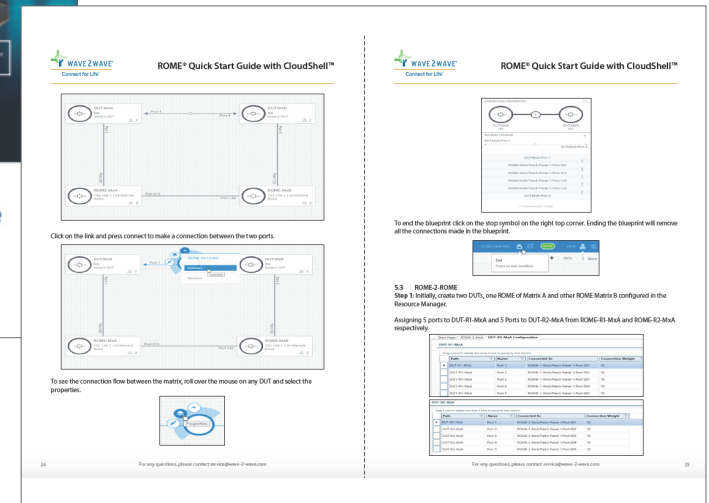

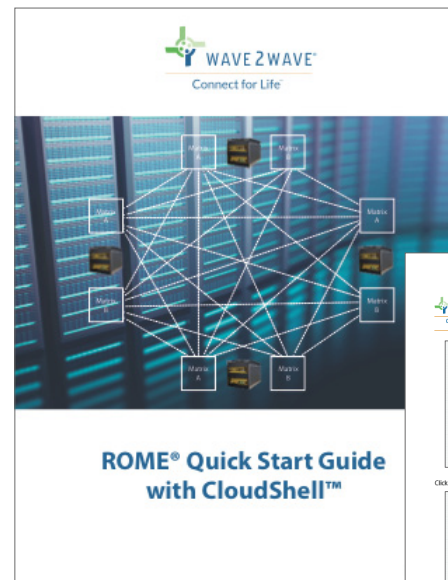

Websites

I created tools to help the sales team communicate with customers. The work included creating the graphics, content, layout and publication.

Supporting Documents

I created technical documentation that included user manuals, technician troubleshooting guides, and operation instructions. I staged the screenshots, executed the commands in CLI, and captured the visuals I needed. I worked with the software engineers to gather content to develop the guides.

Wave2Wave says by removing human interventions, Rome brings the accuracy and consistency to the data center fiber connectivity each and every time.

"It seems to be a dream for robots to perform tasks that a human does not have," the company says. "Rome brings the future to reality now when connectivity is automated and virtualized."

David Wang, Wave2Wave Solution founder and chief executive, says today's digital trends are putting pressure on data centers, and even more pressure on the network architects who design and upgrade them.

"Rome is a game-changing tool," Wang claims. "It reduces the physical cabling in the traditional data center infrastructure by more than 10 times, allowing flexibility, intelligence and control that never existed before."

Wang's comments come as the company adds Rome 500, 1000 and 2000 platforms to its line-up.

The new models include facility for additional fiber connections - 512, 1024 or 2048 respectively, and come in a 13-inch chassis.

A user can send a software command to the robots inside Rome and make hundreds of fiber connections with a click of the button, Wave2Wave says.

The company says Rome can be installed and fully integrated with third party network management or SDN functions.

While the Rome 500 is available now, the Rome 1000 and 2000 are not expected to become available until the second half of this year.

ROME 500, 1000 and 2000 Platforms Automate Physical Fiber Connections in the Data Center

Wave2Wave Solution, the leader and innovator that connects key network elements in the world's largest data centers, today announced its ROME® Robotic Optical Management Engine platform. The ROME 500, 1000 and 2000 robotic optical switching solutions enable full control of physical fiber connections, allowing changes to be made automatically, remotely, quickly, and without manual intervention. With ROME, data center operators benefit from reduced CAPEX and OPEX as well as improved reliability and security, while future-proofing their critical infrastructure.

"Today's digital trends are putting pressure on data centers, and even more pressure on the network architects who design and upgrade them," said David Wang, founder and CEO of Wave2Wave. "ROME is a game-changing tool. It reduces the physical cabling in the traditional data center infrastructure by more than 10 times, allowing flexibility, intelligence and control that never existed before."

ROME can be integrated with Software Defined Networking (SDN) or network management software and is ideal for data center operators, internet, enterprise with IT infrastructure, and large technology test labs. Building on the successful deployments of ROME 360, the ROME 500, 1000 and 2000 platforms are designed in 19-inch chassis with significantly increased density and reduced cost. ROME 500 is now available worldwide, and ROME 1000 and 2000 will become available in the second half of 2016.

Founded in 2003, Wave2Wave Solution has operations in Silicon Valley, Israel, and China. Wave2Wave serves worldwide customers directly and through channel partners. With connectivity as the key focus, Wave2Wave does business in three market segments, including local-level optical interconnect and silicon photonics, data center infrastructure cabling, and robotic optical switching.

Wave2Wave launches a smaller version of its robotic switch

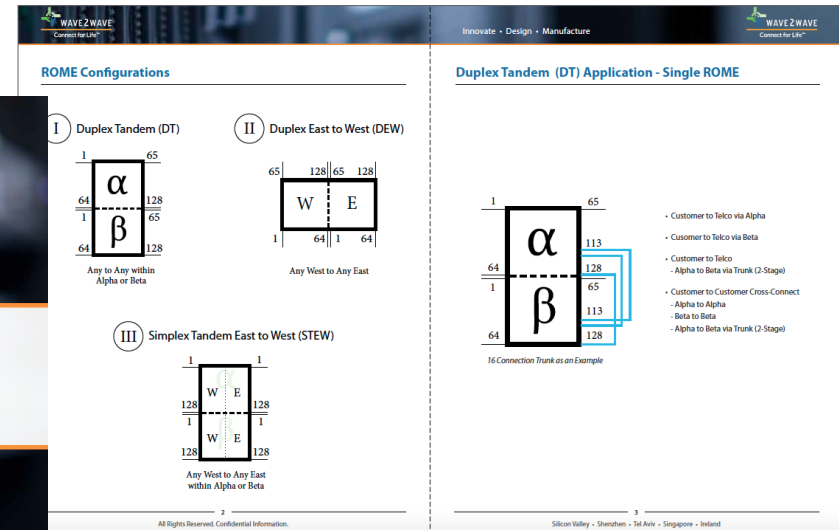

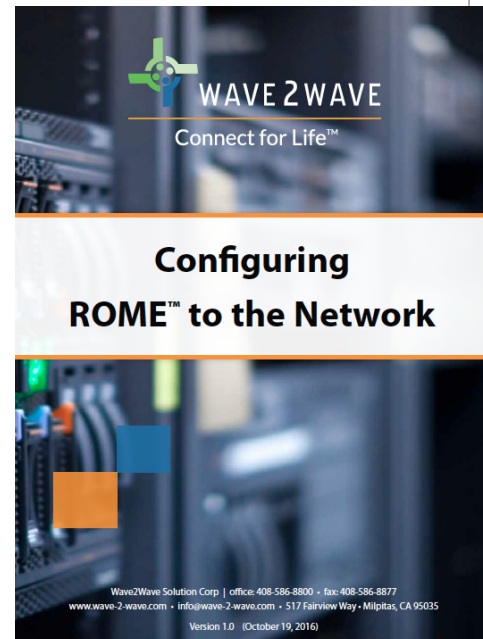

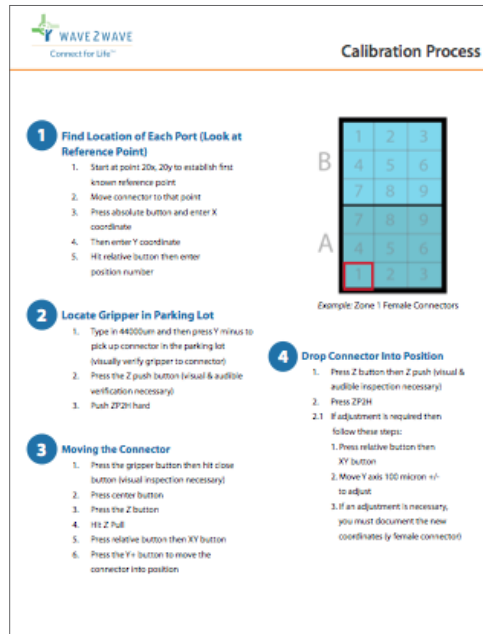

Rome 250 eliminates manual fiber patching, freeing up valuable engineer time

July 18, 2017 by Max Smolens

Wave2Wave is a supplier of optical components and cabling established in 2003. It brought into the market of automated physical connectivity with the acquisition of Israeli company FiberZone in 2014, and promptly produced it.

Rome is a flagship product, consisting of a 19U main chassis built with aluminum alloy, and a 1U logical control unit. The system supports either single mode or multi-mode OM3 OM4 fiber connections, and is integrated with a number of third-party orchestration software platforms.

Technical Support

The last several years, I had added responsibilities of being the technical support manager and leading a team of tech support engineers. Some responsibilities are included below:

- Global support of robotic fiber switches
- Physical deployment and software implementation
- On-site setup hardware and network configurations
- Calibrate robotic movement with precision to the micron level
- Design customer lab configurations with sales engineers
- Provide technical support training and documentation
- Identify and resolve technical issues through remote desktop

Connect for Life™

A New Company...

Fiber Smart
NETWORKS

Now with the beginning of the 2020 year, being a fast-paced technology company, they has decided to re-brand. I am working with leadership to develop the new logo and branding standards. I am currently working on a new website, additional collateral as well as re-brand the existing collateral and graphics.

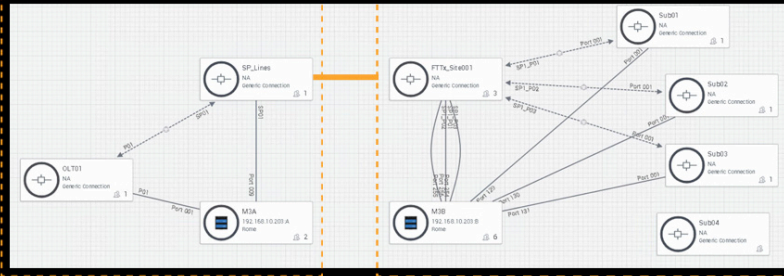

AUTOMATION

Layer-0 — Fiber Smart NETWORKS — SOFTWARE Defined

ROME

Optical Distribution Network (ODN) • FTTx Network • Fiber to the Towers

Automation & Software Defined

Central Office (CO) with OLT & Dynamic Port Activation

Fiber Smart NETWORKS

Curb Side Automation with 100% Subscriber Grooming

Why Fiber Smart in NETWORKS

Connections are Point to Point

Devices are coupled
Resources are underutilized
Networks are not flexible
Operations are manual
Errors occur often
Data is not accurate
Provisioning is slow
Services are disrupted often

Innovation Accelerating

Network Layers 1-7

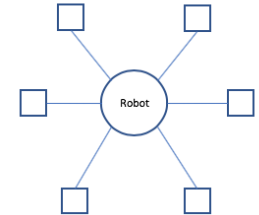

Network Connectivity Layer 0

Once Upon a Time

Fiber Smart NETWORKS

Closing the Gap

Connections are Dynamic

Devices are resources to the network
Utilization is high
Networks are re-configurable
Operations are automatic
Errors are eliminated
Data is accurate
Provisioning is in seconds
Services are always on
Data centers are zero-touch
Connectivity is software defined
Physical layer is part of network

Fiber Smart NETWORKS

The Portfolio

Data Center • 5G • Edge Computing • Telco Network • Hyperscale

All Optical / Passive

- Fiber to Fiber - SM or MM
- Patented Mechanical Latching
- Consistently Low Optical Loss

Zero Impact to Traffic

- No Electronic Latency
- Data Rate Agnostic

Zero Touch Physical Layer

- Software Enabled
- SNMP, REST, Python, CLI
